

# Potomac Defensive Bull (CRDBX)

As of March 31, 2025

## FUND OVERVIEW:

The Potomac Defensive Bull Fund (the “Fund”) will generally use funds that hold a broad-based basket of equity securities. If the Advisor’s algorithmic composites point to a rising market, the Fund will invest in ETFs that provide leveraged exposure of a particular market index, such as the S&P® 500 Index. The Fund may also invest directly in derivatives, such as futures contracts to provide leveraged exposure to a particular market index. During downward trending markets, the fund will attempt to reduce downside exposure by limiting the Fund’s investments to cash. The Fund may also invest in fixed income securities with longer maturities. If the trend is weak enough the Fund’s assets may be invested in ETFs that provide inverse exposure of a particular market index, such as the S&P® 500 Index.

## QUICK FACTS

Ticker	CRDBX
Inception Date	07/01/2020
Category	Tactical Allocation
AUM	\$1.330 Billion

## KEY FEATURES

Investment decisions are made based on mathematical formulas and market tested indicators to:

- Identify times when it is most advantageous to be invested in the equity market
- Employ the strategic use of leverage
- Manage risk
- Maintain a lower correlation to traditional equity benchmarks

## Alternate between RISK-ON and RISK-OFF

## FUND DISCLOSURES

Investors should consider the investment objectives, risks, charges and expenses of the Funds carefully before investing. The prospectus contains this and other information about the Funds. You may obtain a prospectus at [www.potomacfunds.com](http://www.potomacfunds.com) or by calling the transfer agent at 1-888-774-6679. The prospectus should be read carefully before investing.

An investment in the Funds is subject to investment risks, including the possible loss of the principal amount invested. There can be no assurance that the Funds will be successful in meeting their objectives. The risks associated with the Funds, detailed in the Prospectus, include the risks of investing in exchange traded funds (ETFs). To the extent a Fund invests in ETFs and mutual funds, the Fund will indirectly bear its proportionate share of any expenses (such as operating expenses and advisory fees) that may be paid by the underlying funds. These expenses would be in addition to the advisory fee and other expenses that the Fund bears in connection with its own operations. Investment in an exchange traded fund (ETF) carries security specific risk and the market risk. There also may be risks associated with the Funds' investment in a specific sector, and non-diversification. The Funds may also engage in short-term trading to try to achieve its objective and may have portfolio turnover rates significantly in excess of 100%. Futures Risks – Futures contracts are standardized agreements to buy or sell a specific asset at a predetermined price at a future date. Futures may be used to manage risk, gain market exposure, or enhance returns. The use of futures involves leveraging assets which may amplify gains or losses and increase volatility. Leveraged ETF Risks – The net asset value and market price of leveraged ETFs are usually more volatile than the value of the tracked index or of other ETFs that do not use leverage. Inverse ETF Risks – Inverse ETFs seek investment results that are the opposite of the daily performance of an underlying index or basket of stocks. Investors will lose money when the Index rises – a result that is the opposite from traditional funds. The Funds may invest in underlying funds that hold fixed income securities and foreign securities. Fixed income securities fluctuate with changes in interest rates. Typically, a rise in interest rates causes a decline in the value of fixed income securities. Foreign investments can involve significant risks in addition to the risks inherent in U.S. investments. These risks include adverse political, social and economic developments, differing auditing and legal standards, war, expropriation and nationalization.

S&P 500 measures performance of large cap U.S. equities. It is a market-value-weighted index of 500 stocks. The weightings make each company's influence on the Index performance tied proportionately to market value of the company. It is not possible to directly invest in an unmanaged index.

The S&P Target Risk Aggressive Index is designed to measure the performance of aggressive stock-bond allocations to equities, seeking to maximize opportunities for long-term capital accumulation. It may include small allocations to fixed income to enhance portfolio efficiency. The index is made up of 80% equities and 20% fixed income.

### IMPORTANT DEFINITIONS USED IN THIS REPORT

**Beta:** Beta is a measure of the Fund's volatility versus the benchmark.

**Correlation:** Correlation measures how a fund's return moves in relation to an index benchmark.
